## DETAILED ACTION

This Office Action is in response to the election filed 23 March 2005.

### ***Election/Restrictions***

Claims 9-16 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected method of making a semiconductor device, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on 23 March 2005.

Applicant's election without traverse of claims 1-8 in the reply filed on 23 March 2005 is acknowledged.

### ***Claim Rejections - 35 USC § 102***

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-8 are rejected under 35 U.S.C. 102(b) as being anticipated by Segawa et al. U.S. Patent 5,786,589).

Segawa discloses an imaging sensor (Fig. 1) that contains a chip-on-film (COF) film including an electrically insulating layer (104) and a plurality of metal traces (105), the insulating layer having an upper surface, a lower surface and at least an opening (106), each metal trace having a connect pad (area under bump), the connect pads being disposed around the opening on the upper surface, an image sensing chip (112) being mounted on the upper surface of the COF film, the image sensing chip having an

active surface, the active surface includes an image sensing region (area with the lenses) being aligned with the opening, the image sensing chip having a plurality of flip-chip bumps (113) at perimeter of the active surface, the flip-chip bumps being electrically connected with the connect pads and a transparent glass (101) bonded to the lower surface of the COF film corresponding to the opening so as to form a hermetic gap between the transparent glass and the image sensing chip.

The opening is larger than the imaging sensing region of the imaging sensor chip but smaller than the active surface

A filling material (111) formed on the upper surface of the COF film to fill around the opening, thereby sealing the gap, where the filling material is formed of an anisotropic conductive paste, anisotropic conductive film or thermosetting adhesive.  
(Column 6, lines 40-43)

The metal traces are formed on the upper surface of the electrically insulating layer

A metal layer (113) is formed over the connect pads
